The library was constructed by Brandi Chiapelli and Dr.
James McCarter at Washington University, St. Louis. The
CDNA was made by using Dynabead oligo-dT priming (Dynal).
PCR based library using a modified protocol from the
SMART PCR CDNA Synthesis Kit from Clontech. Directionally
cloned into the UDG sites of pAMP1. Nematodes were
provided by Dr. Warwick Grant of AGRearch, New Zealand
(warwick.grant@agresearch.co.nz). Worms were harvested
from Australian brush-tailed possum (Trichosuri vulpecula
) and washed thoroughly to remove host contamination.
Note that despite this effort, host contamination of the

Determination of this BAC-end sequence was carried out as part of a collaboration with the European Drosophila Genome Project (EDGP) - http://www.edgp.ebi.ac.uk -. This Drosophila melanogaster BAC library (Dros BAC) was made by Alain Billand at CEPH (Centre d'Etude du Polymorphisme Humain) with funding provided by a MRC project grant. The DNA was prepared from embryos by Alain Bucheton and Genevieve Payan. It has been constructed in the vector

Genomic DNA isolated from broth cultures of E. histolytica using a method described by Clark and Diamond, L.S. (1993) Entamoba histolytica: a method for isolate identification. Exp. Parasitol.
77:450.; The DNA was mechanically sheared to give a tight size distribution (~2 kb). The v + i method used for the library construction is described in detail in Smith, u h and very library construction is described in detail in Smith,

- Ollaboration with the Barkeley Drosophila Genome Project

collaboration with the Barkeley Drosophila Genome Project

The BDGP is constructing a physical map of the Drosophila

melanogaster genome using these BACs. For further information

please see http://www.fruitfly.org The BDGP Drosophila

melanogaster BAC library was prepared by Kazutoyo Gosegawa and

Aaron Mammoser in Pieter de Jong's laboratory in the Department of

Cancer Genetics at the Roswell Park Cancer Institute in Buffalo,

NY. The library is named RPCI-98 and was constructed by partial

ECORI digestion of Drosophila DNA provided by the BDGP from the

isogenic strain y2; cn bw sp, the same strain used for the BDGP's

Pl and EST libraries. A more detailed description of the library

and how to order individual BAC clones, the entire library, or

filters for hybridization from the BACPG Resource Center can be
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  GSS 04-JUN-1999
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ö

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   A Geneseq 19Jun03:*

                                                                                                                          treptococcus yogenes), comprising one of 5483 sequences (Streptococcus/GAS (Streptococcus pyogenes), comprising one of 5483 sequences (S1), given in the proteins have antibacterial and antihitlammatory activity. (I), nucleic acids encoding (I), ABM66044-ABM71526 and antihitlammatory cartivity. (I), nucleic acids encoding (I), ABM66044-ABM71526 and antibodies that bind (I) are used in the manufacture of medicaments for the treatment or prevention of infection or disease caused by Streptococcus bacteria, particularly salalaties and S. Pyrogenes. Nucleic acids encoding (I) are used to detect Streptococcus in a biological sample. (I) is used to determine whether a compound binds to biological sample. (I) is used to determine whether a compound binds to used as a vaccine or diagnostic composition. The disease caused by Streptococcus that is prevented or treated may be meningitis. Nucleic acid encoding (I) may be used to recombinantly produce (I) and may be used in gene therapy. Antibodies to (I) are used for affinity chromatography, immunoassays, and distinguishing/identifying

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The sequence shows a gene product corresponding to a Streptococcus pyogenes DNA-ase-B. The protein is useful as a diagnostic agent, accine or as an aerosol to trea excessive lung viscosity, e.g. in cystic fibrosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                       New DNA encoding Streptococcus pyogenes DNase B - for diagnosing
S. pyogenes infection, also new promoter for expressing other

It is strongly associated with group A Streptococci and the nucleotide sequences can be used for the microdetection of the gene and provide an early diagnosis of infectious disease caused by the bacteria. (Updated on 25-MAR-2003 to correct PN field.)

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Streptococcus pyogenes DNase B, including the leader peptide, has the amino acid sequence given in AAR8881. The enzyme can be obtd. on a large scale by expression of encoding DNA (AAI12774) in transformed host calls, esp. Escherichia coli. Inclusion of the leader peptide facilitates purification of the recombinant enzyme. The DNase B is useful in immunoassays to detect anti-DNase B antibodies in serum as a marker for S. pyogenes infection, and is also useful as a vaccine or for treatment, via aerosol delivery, of cystic fibrosis.
                                                                                                                                                                                                                                                                                                                                                                                               DNA encoding Streptococcus pyogenes DNase B - for recombinant
dn. of the enzyme in other bacteria, useful in immunoassays or
treating cystic fibrosis

                                                                                                                                                                                                                                                                                   New DNA encoding Streptococcus pyogenes DNase B - for diagnosing S. pyogenes infection, also new promoter for expressing other proteins
                                                                                                                                                                                                                                                                                                                                                                                                                    The sequence represents the N-terminal fragment of Streptococcus
                                                                                                                                                                                                                                                                                                                                                                                                                                     pyogenes DNA-ase-B, which is a marker of S. pyogenes infection. The protein may be used as a diagnostic agent or vaccine for S. pyogenes, or may be used as an aerosol to treat excessive lung viscosity, e.g. in Cystic fibrosis. (Updated on 25-MAR-2003 to correct PN field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        DNase B; nuclease; cystic fibrosis; vaccine; immunoassay; diagnosis; Escherichia coli.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      32.2%; Score 456; DB 16;

                                                                                                                                 is the product of DNA clone lambda 2-6 (AAT12773) isolated from a S. pyogenes DNA library. A full-length sequence is given in AAR8823. The insert of the DNase B-encoding DNA clone can be transferred to expression plasmids for large-scale recombinant DNase prodn. in E. coli or other bacterial hosts. It is used in mannoassays to detect anti-DNase Banthodies in serum as a marker of S. pyogenes infection, and is also useful as a vaccine or for cystic fibrosis treatment via aerosol delivery.
                                                       New DNA encoding Streptococcus pyogenes DNase B - for recombinant prodn. of the enzyme in other bacteria, useful in immunoassays or for treating cystic fibrosis

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The N-terminal sequence (AAR88825) of a Streptococcus pyogenes recombinant DNase B expressed in Escherichia coli transformants was detd. A modified DNase B gene (AAT12780) was produced by PCR amplification of the native DNase B gene (AAT12774) in clone lambda The gene was inserted into vector del-33 for expression in E. coli. Modification of the gene resulted in the presence of an additional Arg residue at the DNase B N-terminus (see also AAR88824).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   New DNA encoding Streptococcus pyogenes DNase B - for recombinant prodn. of the enzyme in other bacteria, useful in immunoassays or for treating cystic fibrosis

                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The invention relates to a protein (ABP25413-ABP30895) from group B streptococcus/GBS (Streptococcus agalactiae) or group A streptococcus/GBS (Streptococcus gyalactiae) or group A streptococcus/GBS (Streptococcus pyogenes), comprising one of 543 sequences (S1), given in the specification. The proteins have antibacterial and antiinflammatory activity. (I), nucleic acids encoding (I), ABN66044-ABN1526 and antibulodies that bind (I) are used in the manufacture of medicaments for the treatment or prevention of infection or disease caused by Streptococcus bacteria, particularly S. agalactiae and S. pyrogenes. Nucleic acids encoding (I) are used to detect Streptococcus in a biological sample. (I) is used to detecraine whether a compound binds to used as a vaccine or diagnostic composition. The disease caused by used and any be meningitis. Nucleic acid encoding (I) may be used to recombinantly produce (I) and may be used in gene therapy. Antibodies to (I) are used for affinity chromatography, immunoassays, and distinguishing/identifying

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             rettelin H;
                                                                                                                                                                                                                                                                                                                                                                                       ABP25596;
```

The invention relates to a protein (ABP25413-ABP30895) from group B streptococcus/GBS (Streptococcus agalactiae) or group A streptococcus/GBS (Streptococcus pyogenes), comprising one of 5483 sequences (S1), given in the specification. The proteins have antibacterial and antiinflammatory activity. (I), nucleic acids encoding (I), ABN6604-ABN71526 and activity and that bind (I) are used in the manufacture of medicaments for the treatment or prevention of infection or disease caused by Streptococcus bacteria, particularly S. agalactiae and S. pyrogenes. Streptococcus and particularly S. agalactiae and S. pyrogenes. Streptococcus ample. (I) is used to detect Streptococcus in a biological sample. (I) is used to detectine whether a compound binds to used as a vaccine or diagnostic composition. The disease caused by Used as a vaccine or diagnostic composition. The disease caused by a streptococcus that is prevented or treated may be meningitis. Nucleic acid encoding (I) may be used to recombinantly produce (I) and may be used in gene therapy. Antibodies to (I) are used for affinity strentoccus in a proper antibodies to (I) are used for affinity strentoccus in a processing that is prevented or treated may be negative to acid encoding (I) and may be a promatography, immunoassays, and distinguishing/identifying Streptococcus proteins.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           frequence (ARA90521) and related proteins (ARB55021). The nucleic acid sequence is useful in the detection and/or amplification of nucleic acid sequence, particularly to identify Lactococcus lactis or related species. The proteins of invention are useful for the biosynthesis or biodegradation of a composition of interest. The invention helps research in lactic bacteria, particularly useful in the production of yogurt and cheese.

Note: The sequence data for this patent is based on equivalent patent WO200177314 (published 18-OCT-2001) which is available in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences.

streptococcus/GBS (Streptococcus agalactiae) or group A streptococcus/GAS (Streptococcus pyogenes), comprising one of 5481 sequences (51), given in the specification. The proteins have antibacterial and antiinflammatory activity. (I), nucleic acids encoding (I), AM86044-ABN71526 and antibodies that bind (I) are used in the manufacture of medicaments for the treatment or prevention of infection or disease caused by Streptococcus bacteria, particularly S. agalactiae and S. pyrogenes. Nucleic acids encoding (I) are used to detect Streptococcus in a biological sample. (I) is used to determine whether a compound binds to li). A composition comprising (I) or a nucleic acid encoding (I), may be used as a vaccine or diagnostic composition. The disease caused by Streptococcus that is prevented or treated may be meningitis. The invention relates to a protein (ABP25413-ABP30895) from group B streptococcus/GBS (Streptococcus agalactiae) or group A streptococcus/GBS (Streptococcus agalactiae) or group A streptococcus/GBS (C Streptococcus pyagenes), comprising one of 5483 sequences (S1), given in the specification. The proteins have antibacterial and antimifiammatory ct the specification. The proteins have antibacterial and antimifiammatory cativity. (I), nucleic acids encoding (I), ABN66044-ABN71526 and catibodies that bind (I) are used in the manufacture of medicaments for the treatment or prevention of infection or disease caused by Streptococcus bacteria, particularly S. agalactiae and S. pyrogenes. C Nucleic acids encoding (I) are used to detect Streptococcus in a compound binds to biological sample. (I) is used to determine whether a compound binds to composition comprising (I) or a nucleic acid encoding (I), may be used to determine whether a compound binds to consider that is prevented or treated may be meningitis. Nucleic acid encoding (I) may be used to recombinantly produce (I) and may be chromatography, immunoassays, and distinguishing/identifying corrects proteins.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                61 PSRELSESVLTSNVKKQLGTNIAM--NQSGAFIINQNKTDLNAKVSSA--PYAINEIKKV 116

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Bacteriol. 183:5703-5717(2001).

-i. FUNCTION: By degrading DNA that enters the cell, plays a role the competence of cells to be transformed.

-i. SUBGELLULAR LOCATION: Membrane-bound.

-i. SIMILARITY: Belongs to the DNA/RNA non-specific endonuclease
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    SEQUENCE FROM N.A.
